Results & Application

Climate change is exacerbating wildfires

Our goal:

Predict which fires will become
“catastrophic,” and aid fire
departments in decision making and
resource allocation

Our Results

Interpretability

Identified conditions that lead to large fires

- Remoteness of Location
- Lightning Storms
- Wind Speeds
- Geographic Location

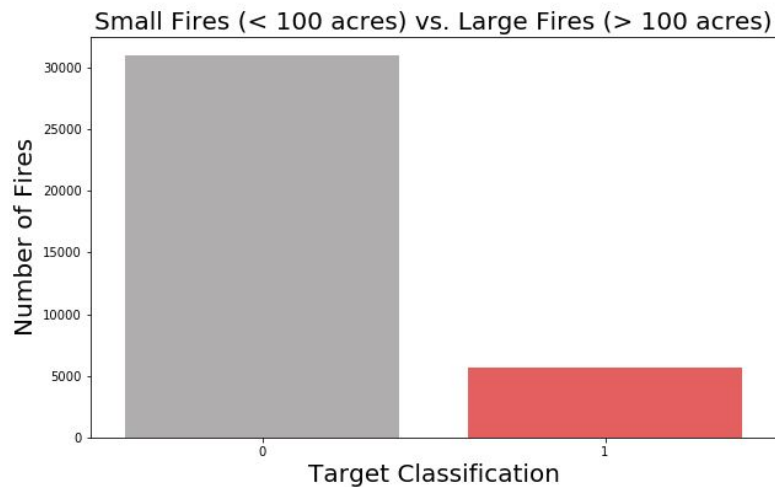

Predictive Power

Created models to accurately predict size of fires

- $F1 = 0.82$
- Precision = 0.98
- Recall = 0.70

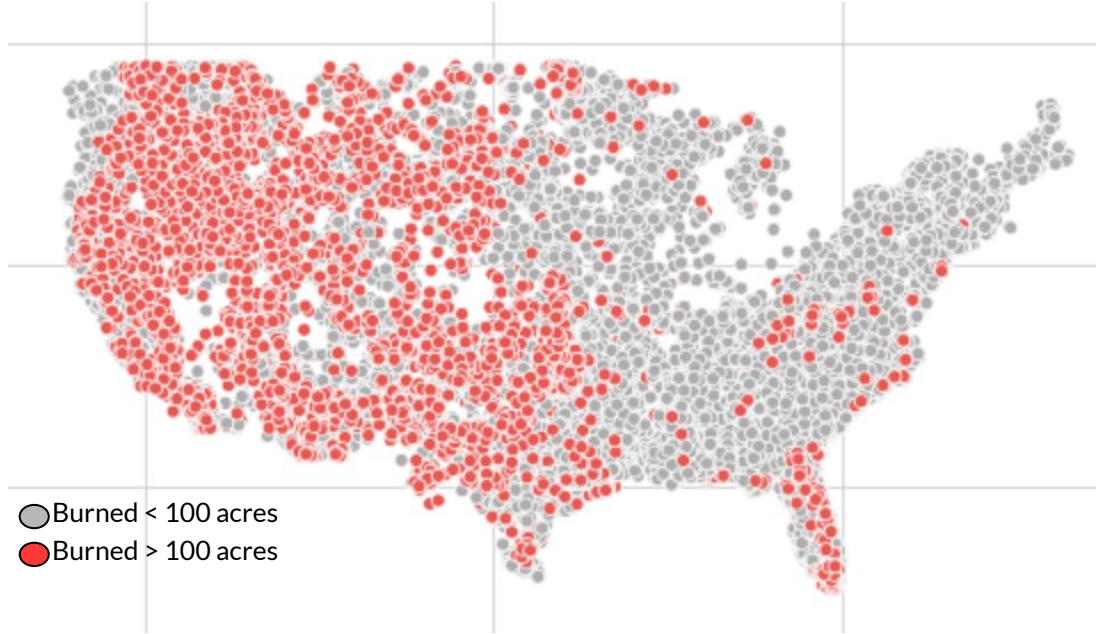

The Data

Retrieved From

- Forest Service Research Data Archive
- NOAA National Centers for Environmental Information

Our Process

Wildfires in US, 1992-2015

(Not pictured, AK, HI, & PR)

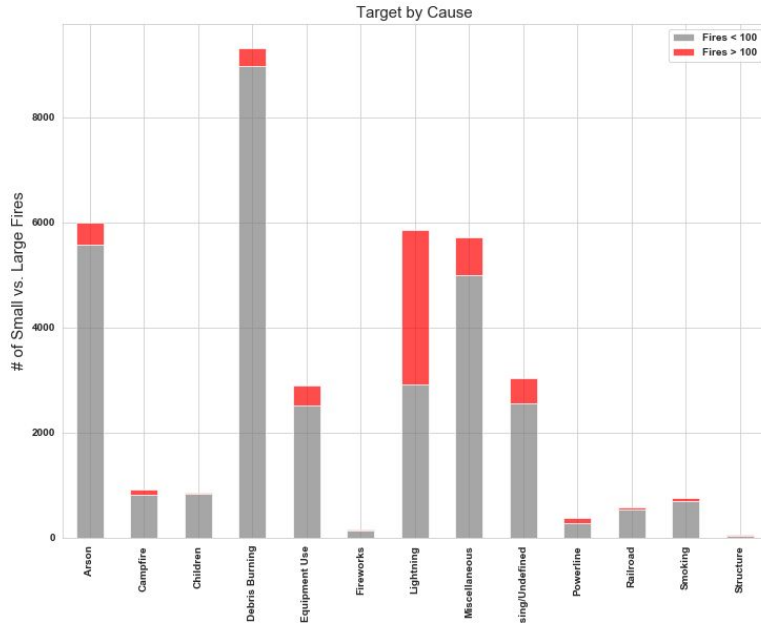

Feature Engineering

- Categorical Dummies (Vegetation, State, Month)
- Remoteness
- Location in US
- Wind Speeds
- Humidity Levels

Results

1) Catching a fire early will reduce risk of a fire getting out of control

2) Climate during start of fire

Next Steps & Further Research

More Data

- Nearest Road
- Nearest Fire Tower

More Clear Features

- Meaning of some features

Focus On Western United States

Thank you!
